BOX PATENT APPLICATION
ASSISTANT COMMISSIONER FOR PATENTS
Washington, D. C. 20231

PRELIMINARY AMENDMENT

Dear Sir:

Please amend the above-identified patent application prior to its examination.

AMENDMENTS

In the Specification

- - This application is a continuation of co-pending application Serial No. 09/184,752 filed November 2, 1998 entitled "System and Method of Investment Management Including Means to Adjust Deposit and Loan Documents for Inflation," which is a continuation of U.S. Patent No. 5,832,461, filed November 23, 1991, which is a continuation of Serial No. 07/187,054, filed April 27, 1988, now abandoned, which is a continuation of U.S. Patent No. 4,742,457, filed August 27, 1985. - -

In the Claims

Please amend the claims as follows:

Please cancel claims 1 through 33.

Please add claims 34 through 45.

41 The financial instrument of claim 38, wherein said debt instrument comprises a bond, a certificate of deposit or an annuity account.

42. An inflation adjusted financial instrument comprising:
a principal component;
an accrual component having fixed and variable interest components payable at the end of a term of the financial instrument, said variable interest component being adjusted for inflation based on the Consumer Price Index (CPI); and
wherein the principal component is payable at the end of the term of the financial instrument.

43. The financial instrument of claim 42, wherein said Consumer Price Index (CPI) comprises the Consumer Price Index for all urban consumers (CPI-U).

44. The financial instrument of claim 42, wherein said financial instrument comprises a debt instrument.

45 The financial instrument of claim 44, wherein said debt instrument comprises a bond, a certificate of deposit or an annuity account.

REMARKS

This is a continuation of Serial No. 09/184,752, filed November 2, 1998 for which a Notice of Allowance issued December 20, 1999, allowing claims 34-54 and 58-64. Claims 55-57 and 65-67 from that application are the basis for Claims 34-45 of the present application.

CONCLUSION

The Examiner is invited to contact the undersigned attorney at 512-794-3626 with any questions, comments or suggestions relating to the referenced application.

BACKGROUND OF THE INVENTION

1. Field of the Invention

5 This invention relates to financial management systems and, more specifically, to data processing methodology for effecting an improved capital structure in financial institutions.

10 2. Description of the Prior Art

A number of financial management systems have been proposed in the past. Exemplary systems include U.S. Patent Numbers 4,194,242; 4,232,367; 4,321,672; 4,346,442
15 and 4,376,978. However, such prior systems address substantially different problems and accordingly, are substantially different from the inflation-adjusting program of the present invention.

20 During times of inflation, lenders and borrowers, whether they be institutions or individuals, must anticipate what the effects of inflation will be on the cash flow characteristics of a loan. Investors face a similar uncertainty. Traditionally, lenders compensate
25 for this uncertainty by including a premium in the interest rate charged on the loan. This premium represents what the lender feels will be the level of inflation during the term of the loan.

30 Loans which include a fixed inflation compensation factor are not immune to the effects of inflation. For example, when a lender anticipates a 6% annual inflation over the life of a loan and the actual average inflation turns out to be 10%, the lender has realized a 4% annual
35 loss in terms of real dollars. In addition, standard-fixed-payments loans ("SFPM's") exhibit a progressive

00440" 25/0560

decline with time in terms of the flow of real dollars leading to a real-payment forward "tilt" characterized by a much greater equity accumulation during the early years of an extended loan. Conventional SFPM's are particularly
5 burdensome in an inflationary environment in that they fail to account for appreciation of the mortgaged property.

In an attempt to compensate for such an eventuality,
10 some lenders have offered loans or mortgages which include a floating interest factor that is periodically varied in some manner to compensate for the effects of inflation. One such alternative mortgage instrument is the adjustable rate mortgage, or "ARM", which allows for periodic
15 adjustment of payments to compensate for what the lender feels will be the inflationary effect on the loan during the upcoming period. For example, a typical ARM is indexed to a standard interest rate such as a particular bank's prime rate or six-month Treasury bill average.
20 However, due to the fact that ARM's still reflect the market's "expectation" of the inflation rate, their inflation premiums may still not reflect the actual rate of inflation.

25 Two mortgage loan instruments which are directly indexed to inflation have been offered on a limited basis. One such instrument is the price-level adjusted mortgage, or "PLAM," whose mortgage balance is periodically adjusted to account for the effects of inflation during the
30 interval since the previous adjustment. PLAM's have generally been indexed to one of the various consumer price indexes. Such indexing of the PLAM loan balance results in the deferral and capitalization of additional interest. The resulting PLAM loan serves to even out
35 equity accumulation during the life of the mortgage in contrast to SFPM's.

00440 2520560

Another indexed mortgage instrument is the "modified" PLAM which combines some aspects of the traditional fixed rate mortgage with those of the PLAM. In particular, the modified PLAM has a fixed interest rate which includes a
5 specified inflation factor and, in addition, has a variable interest rate which will compensate the lender for inflation over and above the specified inflation factor.

10 Inflation-indexed loan instruments have advantages in that inflation risk to the lender is minimized. For example, with SFPM's during periods of inflation, the borrower realizes a windfall in terms of actual dollars where the loan rate is based on a low level of anticipated
15 inflation. Conversely, the lender has suffered a loss in terms of real dollars. Inflation indexed loans serve to solve this problem. However, the borrower under such instruments still faces much uncertainty: when inflation spirals, so do the loan payments. If inflation operates
20 similarly on the mortgaged or secured property, there is no loss in terms of real dollars. However, if the value of the property securing the loan does not inflate at the same rate as the loan balance, there is potentially an inflation loss.

25

Such problems have in the past prevented large-volume or commercial borrowers from taking advantage of inflation-indexed loans. That is, the uncertainty over whether the return on inflation-indexed borrowed funds
30 which have been reinvested, will compensate for the "cost" of those funds. This problem of unbalanced investments and loans is seen most acutely where one wishes to invest in a manner that will assure an inflation-adjusted return on the investment. One answer would be for institutions
35 to accept investment capital into deposit accounts which insure an inflation-adjusted return on the deposited

00440" 2325550

09550753-044700

funds. However, the risk to the lending institution is clear: such inflation-adjusted deposit accounts must in some manner be backed by inflation-adjusted dollars. Equally important, institutions engaged in lending and borrowing funds require the ability to match funds which have been obtained on an inflation-indexed basis with some similary indexed funds which are lent out. Moreover, such institutions require the ability to assess the impact of inflation-adjusted deposit and loan accounts on their capital structure.

Accordingly, the present invention addresses these problems by providing a system for implementing inflation indexed deposit accounts, for matching such accounts with similarly indexed loan accounts and for anticipating the effects of these accounts on the existing capital structures of the institution or investor.

SUMMARY OF THE INVENTION

The foregoing and other problems of the prior art are solved by the system of the present invention which institutes inflation-adjusted deposit and loan accounts and matches such accounts to provide an improved capital structure for a financial institution. The system projects the impact of inflation-indexed deposit and loan accounts on the institution's capital structure for preselected or anticipated inflationary environments. Based on such projections and other general considerations, one of several forms of deposit accounts is selected according to the requisites of the depositor or borrower and those of the institution.

As contemplated under the present invention, the accounts are characterized by a principal component and an accrual component. Principal component is that proportion

of the overall account balance attributable to the initial cash investment. The accrual component indicates that proportion of the overall account balance attributable to inflation and fixed interest. The account components are periodically enhanced or reduced in a manner specified by the characteristics of the particular account selected.

The accrual component will generally include both a fixed interest component and a variable interest component with the variable interest component being responsive to the rate of inflation. Responsive to the rate of inflation, as used herein, means directly responsive to a market indicator of prior actual inflation as it is not meant to include the market's expectation of future inflation. Under one alternative, the principal component is enhanced by the variable interest component and the account retired by retiring the fixed interest component by one schedule and retiring the principal component by a second schedule. However, the account may be retired by retiring both components over a similar schedule or by amortization. By varying the manner in which each respective component is accrued or retired, the cash flow characteristics of the account can be significantly altered to fit the requisites of the individual or institution. Cash flow is defined as the overall flow of cash units from the account, or a selected account component, to the account holder who will either be the lender or depositor, at a specified time.

Since the accrual component of either loan or deposit accounts may be adjusted in response to inflation, they can potentially exhibit unfavorable cash flows. Therefore, it is generally desirable to match loan accounts with deposit accounts, and further generally desirable to match accounts with similar intrinsic cash flow characteristics as specified by their accrual and retirement

features. In this manner, cash flow patterns of the loan account would mirror those of the matched deposit account. Thus, during times of inflation, for example, negative cash flows attributable to outgoing retirement payments on deposit accounts will be compensated for by incoming payments on loan accounts.

Once the appropriate form of deposit and loan accounts are selected, matched and placed with the institution, data processing is utilized to service them during their respective terms. As referred to herein, the account term is the time period over which the account is retired or "paid out" to the account holder. The account term is generally divided into a plurality of adjustment or iteration periods, however, terms may be scheduled to include only a single iteration. Servicing includes the determination of inflation adjustments to the account balance or, alternatively, the inflation premium due the account holder. Servicing also includes features which protect the principal or balance of the accounts from the effects of deflation and reports all bookable income to holder.

Servicing further includes data processing for retiring and enhancing the accounts according to their respective terms and schedules. Retirement is meant to include a reduction in the particular account component and enhancement is meant to include an increase or accrual of the particular account component. For example, accrual components may be retired separately from the principal component by selecting separate schedules for each. Thus, for example, the principal may be retired semi-annually and the accrual retired annually. Schedules may be selected which adjust particular components by a predetermined amount. Alternatively, account components may be retired by amortization.

5 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The System

Referring now to Fig. 1, there is shown in overall
10 scope an operational flow chart for implementing the deposit/loan inflation-adjusting system of the present invention. As therein depicted, the broad aspects of the system include an inflation-adjusted deposit account 2, an inflation-adjusted loan account 4, an intermediary
15 institution 6 and an account management dataprocessor 8.

In the most basic embodiment of the present invention, the intermediary institution 6 receives deposited funds in deposit accounts 2 and lends funds
20 through loan accounts 4. Retirement of these inflation-adjusted accounts are implemented by account management dataprocessor 8. Such data processing services the inflation-adjusting accounts in a number of ways, including the determination of their cash flow charac-
25 teristics in changing inflationary environments and determining the anticipated effects of inflation on the account balance. Characteristics of the individual accounts are tailored to meet the needs of the particular depositor.

30

However, as illustrated in Fig. 1, the system of the present invention need not be limited to the three above mentioned fundamental aspects. In a preferred embodiment, an organizing company 10 acts as a synchronizer by
35 contacting depositors 12 through intermediary 6 or through a marketing agent 14, for example, a pension fund manager.

00240" 2520550

Depositor characteristics are listed on a Deposit Funds Available Data File 16 ("DFADF"), wherein characteristics listed include a depositor identifier, the amount of funds available, the term of the account, the duration of the account, the type of account and the account retirement schedule. The amount of funds available is the total amount of funds sought to be deposited by the depositor. The term of the account is the length of time from the initial deposit until maturity (i.e., when the account has been entirely retired). The duration of the account, explained more fully below, is a mathematical expression of when the average time-weighted dollar is paid out of the account. The type of account, also explained in greater detail below, represents the particular accrual and retirement features of the deposit account. The retirement schedule refers to the timing of the iteration or payback periods and may include a predetermined retirement amount where appropriate.

Characteristics of borrowers 18 are similarly listed in a Loan Funds Desired Data File 20 ("LFDDF"), which includes the amount of funds sought to be borrowed, the term of years for which the funds are desired, the duration of the loan account, the type of loan account and the loan account retirement schedule. Additional parameters such as credit rating of the borrower or capacity of the lenders are generally included in the LFDDF or DFADF. Capacity represents the total funds the lending institution may wish to devote to particular categories of loan transactions, for example, commercial development loans.

Data processing capabilities are supplied for displaying and choosing the particular inflation-indexed account characteristics and for servicing the accounts once installed. Organizing company 10 may also act as a

00240" 030950

matching agent to receive deposit commitments from
depositors 12 or marketing agent 14 and place such
commitments with intermediary 6 that may require
inflation-indexed deposit funds to back similarly indexed
5 mortgage loans. Again, intermediary 6 acts as the actual
conduit for the passage of funds but may rely on organizer
10 to match indexed deposit contributors with borrowers
and/or to service accounts 2,4 once they are installed.

10 Servicing the Accounts

In general, four basic types of accounts, represented
by the designations Group I, II, III or IV, are contem-
plated under the present invention. These accounts vary
15 in terms of their cash flow, principal repayment and
interest accrual characteristics. They can be charac-
terized as having a principal component, which initially
represents the sum deposited or loaned, and an accrual
component, which represents that portion of the balance
20 that is attributable to the effects of interest, servicing
fees and inflation on the principal. However, the
accounts of the present invention may vary in terms of how
and to what extent interest accrues, whether the interest
is "payed out" or reinvested into the overall account
25 balance, and how the account is retired over a selected
term.

In their most basic embodiment, Group I accounts
include those accounts wherein the fixed-interest and
30 inflation-adjusted interest components are retired as they
accrue. In Group II accounts, both the fixed and
adjustable components are retained as principal and thus
add to the overall account balance. In Group III and IV
accounts, the fixed interest component is payed out as it
35 accrues and the adjustable component is added to account
balance. Group III and IV accounts differ in that Group

002740" 25205960

5 final iteration.

20 a separate fashion from the principal retirement.

are possible within the Group I framework, and cash flows

could be accelerated through earlier payments of a portion of the principal.

As displayed in the flow diagram of Fig. 2, Group I accounts are serviced by first ascertaining, for example from DFADF or LFDDF, the initial balance, the fixed interest rate to be paid, the inflation index at the time of the deposit or loan, the total number of iterations or adjustment periods, and the schedules by which the principal and accrual components are to be retired. Proceeding through the flow diagram, the first operator, $Ir = Ir-1$, serves as a counter to determine the number of iterations remaining in the scheduled account term. The amount of the principal to be retired by cash disbursement to the account holder is determined by reference to the schedule. Once the current inflation index (CPI_c) is determined, the level of inflation since the last reporting period is estimated by consideration of a preselected inflation index which reflects prior actual inflation. A preferred embodiment of the present invention utilizes the consumer price index $CPI-U$, for all items. However, any number of indexes may be successfully utilized including, but not limited to $CPI-W$, Producer Price Index, the Implicit Price Deflator for the Gross National Product, or any component of these price level measures so long as the index reflects some measure of past inflation. The level inflation which has occurred since the previous iteration period can be determined by the formula:

$$\frac{CPI_c - CPI_o}{CPI_o}$$

Where CPI_o is the inflation index at the time of the last iteration, or the initial index if the present iteration is the first.

The account servicing scheme makes the determination as to whether deflation has in fact taken place since the previous reporting period or iteration period. This test serves to protect against a possible negative cash flow which could result during deflationary periods. If deflation has taken place, no adjustment is made to the balance in response to the deflation, rather, deflation credits are stored and subsequently retired when inflation returns. Deflation credit is accumulated with deflation credit from prior iteration periods, if any, in the form of cumulative deflation credit ("CDC").

If, alternatively, inflation has occurred during the prior iteration period, the cash outflow or disbursement attributable to the effects of inflation on the account balance is determined by applying the inflation rate to the deposit balance. If the cumulative deflation credit is greater than the inflation disbursement, the CDC is reduced by that amount and the accrual disbursement to depositors is determined by applying the fixed interest rate to the principal.

If the CDC value is less than or equal to the calculated inflation disbursement factor, the disbursement factor is reduced in proportion to the CDC, if any, and the CDC set to zero. Accrual repayment is determined by applying the fixed interest rate to the balance and adding the product to the inflation disbursement factor. The account balance is adjusted to reflect both the principal and accrual retirement. Following a test to determine whether any iteration periods remain, the initial CPI (CPIo) is reset to equal the current CPI (CPIc), to allow for inflation rate determination at the next cycle.

Group II deposit accounts are characterized by a principal component that is enhanced by the accrual

00240"04300

component. Thus, principal growth is observed on the one hand and the account is retired by retiring only the principal. Since all inflation and interest adjustments on the account serve to enhance the principal, only one
5 schedule of retirement is required. Group II accounts will generally demonstrate cash flows which do not react as quickly to rising inflation as those of Group I accounts. This is due to the fact that the accrual component of Group II accounts are not necessarily paid
10 out in their entirety at each iteration period as in Group I accounts. Rather, the accrual is retained as principal and retired by a preselected schedule, for example, by retiring a predetermined portion at each iteration period. This results in a straight-line reduction of the account
15 balance during the account term followed by a lump sum payment of the remaining balance at maturity. Alternatively, a schedule may be selected where the entire account is retired by one lump sum payment at maturity with no intervening retirements.

20 Referring now to Fig. 3, is shown a flow chart for servicing Group II accounts. As with Group I accounts, the parameters of initial account balance, fixed interest rate to be charged, the initial inflation index (CPI₀),
25 number of iteration periods, and account retirement schedules are supplied. The amount of principal to be retired is then determined by reference to the schedule. This amount is disbursed to the account holder.

30 The inflation rate is estimated and tested for deflation. If deflation has taken place, deflation credit is calculated and accumulated. If, alternatively, inflation has occurred, the amount of principal adjustment is determined by determining the product of the inflation
35 rate and the account balance prior to the present retirement. Fixed adjustment is represented by the

0055076400

product of the fixed interest rate and the balance. When the cumulative deflation credit (CDC) is greater than the inflation adjustment for any given iteration period, the CDC is reduced in proportion to the inflation adjustment and the account balance adjusted to reflect the principal retirement and enhanced to reflect the fixed adjustment.

Alternatively, when the inflation adjustment is higher than the CDC, the inflation adjustment is reduced in proportion to the CDC and the CDC reset to zero. Balance adjustment is accomplished by reducing the balance in proportion to the principal repayment and enhanced in proportion to fixed and inflation adjustment. Although under Group II accounts, actual cash flow consists of the principal retirement, "bookable" cash flow is represented by both principal retirement and inflation and fixed adjustments to the principal. Thus, this "bookable" inflation adjustment factor is reported to the account holder or borrower for, for example, income tax purposes.

Group III and IV accounts are characterized by an accrual component that is divided into a fixed interest component and a variable interest component with the variable component being responsive to inflation. For both Group III and IV accounts, the fixed interest component may be viewed as a part of the depositor's interest on the balance, and retired by a preselected schedule over the term of the deposit or by amortization. However, the variable interest component serves to enhance the principal and therefore represents a deferral and capitalization of interest into the principal. Therefore, principal growth is observed.

Group III and IV accounts differ in terms of how their respective adjusted principals are retired. In Group III deposits, the principal is retired by a preselected

00240"044700

schedule over the term. Alternatively Group IV accounts have principals which are retired by amortization. Fig. 4 is illustrative of the mechanics of Group IV accounts. As depicted therein, Group IV accounts are serviced by first
5 determining the preliminary series of variables: the amount of the initial deposit, the fixed interest rate to be paid, the inflation index at the time of the deposit (CPIo), the total number of iterations or adjustment periods (Ir) and the retirement schedule.

10

Proceeding through the flow chart of Fig. 4, as with the previous accounts the first operator counts the number of iterations remaining in the scheduled account term. The account balance amortization is calculated to
15 determine that portion of the principal to be retired at that iteration period. In particular, amortization of the balance is achieved using the formula:

20
$$R = \frac{A}{PVIF}$$

where: R is the payment due the account holder;

25 A is the amount of the balance to be amortized; and

PVIF is defined as

30
$$\sum_{I=1}^N \left(\frac{1}{(1+i)^I} \right)$$

where N is the number of iteration periods remaining + 1, and i is the
35 fixed interest rate

The fixed interest component is calculated by
40 applying the fixed interest rate to the account balance. Once determined, fixed interest component is generally retired during the present iteration by disbursement to

00550763 04100

the account holder. Alternatively, the fixed component may be withheld for later retirement, depending upon the requirements of the particular schedule.

5 The inflation rate is estimated and tested for
deflation. With Group IV accounts, during times of
deflation, one would expect a diminishment of the balance
in proportion to the resultant increase in "real" dollars
on deposit. However, the present system avoids this
10 diminishment by storing deflationary units in the form of
deflation credit. As with the foregoing account groups,
deflation credit is cumulated, reserved and not applied
against the account balance until inflation resumes to a
sufficient level to counter it.

Thus, when the inflation adjustment is greater than the CDC, the account balance is reduced in proportion to the principal retired and enhanced in proportion to the level of inflation. If deflation credit has accumulated to a greater extent than the inflation adjustment during the prior iteration period, the balance is reduced only in proportion to the principal retirement. Once a new balance is established, the iteration cycle is completed by testing whether the present cycle represents the final iteration period and, if not, by setting the index level of the present cycle equal to the initial index for use in the next cycle.

The flow chart of Fig. 4 may be modified to service Group III accounts by retiring a set proportion or amount of the balance instead of amortizing the balance. Since such a retirement is of a "preselected amount," the final iteration may include a lump sum payment of the balance which remains. That is, the principal retirement of Group III accounts, being a preselected amount, would not necessarily track the inflation adjustments, thus

35

16 and LFADF 20, representing supply funds and demand funds, respectively.

Accounts are matched by matching parameters stored in DFADF 16 or LFDDF 20 to create a Hierarchical Matching File 30 ("HML"). Parameters of the demand and supply files 16,20 are thus matched according to hierarchal considerations generally including account amount, term and duration as primary considerations. A plurality of loans may be matched with a single deposit, or a plurality of deposits with a single loan, in order to match the overall amounts. In situations where a plurality of loans are matched with a plurality of deposits, the various amounts are totaled to achieve a total balance match.

Duration is a mathematical expression of when the average time-weighted dollar is either received or paid out of a particular account. It provides information concerning the size and timing of the payment stream or cash flow of the account. Moreover, duration embodies an expression of the relation of payment or disbursement size to yield-to-maturity of the account. The mathematical expression of the formula is:

$$D = \frac{\sum_{t=1}^m \frac{tCF_t}{(1+r)^t}}{\sum_{t=1}^m \frac{CF_t}{(1+r)^t}}$$

Where D = duration, r = yield-to maturity, t = time of cash flow, m = term and CF_t = cash flow at time, t.

When this formula is applied for example, to a \$1,000 standard-fixed-payment deposit account with a five-year term and 12% total annual interest, the calculated duration is 4.04 years. That is, the average time-weighted dollar is paid out at 4.04 years. In general, group I accounts will show greater cash flows early in their terms relative to group II accounts, therefore group I accounts will often have lower durations than scheduled group II accounts. The duration of Group III and IV accounts will generally fall between that of Group I and II accounts. Therefore, duration is an expression of the average cash flow of the account. In matching the duration of a loan account with that of a deposit account, or in matching the average duration of a plurality of accounts, the cash flows of deposit and loan accounts so matched will compensate for one another, thereby protecting the capital structure of the intermediary.

After matching is achieved by the HMF 20, borrowers 18 and depositors 12, or their respective account managers 22,14, are notified of the match and deposit and loan accounts 2,4 are formalized 32 followed by the transfer of funds 34 to intermediary 6. Accounts will then be serviced by the account management dataprocessor 8.

25

Example I:
Servicing of Inflation - Adjusted
Deposit Accounts

30 Data processing and post-data processing activities are utilized to service the Group IV deposit accounts of the present invention by periodically adjusting the outstanding balance of the account to reflect the effects of inflation on it.

35

a. Mechanics of a Typical Group IV Deposit Account

Referring to Fig. 6 is shown a representative example of a hypothetical Group IV deposit account in terms of its
5 year-end balance and adjustment amortization. The deposit account therein depicted assumes an initial balance of \$100, a fixed annual interest rate of 4%, a steady inflation rate 8% (e.g., an 8% steady annual increase in the CPI), a 30-year term with 30 annual iteration periods,
10 and a schedule which retires the fixed interest component as it accrues (i.e., annually).

As will be appreciated by those skilled in the art, the deposit account of the present example is somewhat
15 similar to a 30-year annuity which is supplemented annually with additional annuities to reflect the higher price level in the economy. Thus, the fixed amortization rate becomes a real interest rate because the depositor also receives additional interest equal to the inflation
20 rate multiplied by the account balance. Each iteration period, if there is a positive increase in the CPI, additional inflation interest accrues but it is payable over the remaining term as an additional stream of annuity payments. The deposit account can be viewed as 30
25 separate annuities with an original annuity and potentially 29 annual inflation additions.

The depositor's total receipts (including principal and interest) on the deposit account increase in lock-step
30 with the CPI so that the payment the depositor receives is constant in real purchasing power. In this graphical presentation the inflation rate is a steady 8% for the entire 30-year term of the account so the depositor's payment increases by 8% each year. The deposit balance
35 changes on any distribution date since inflation interest is added to the deposit balance and the annuity payment

09550752 044700

retires a portion of the existing principal with each iteration. Fig. 7 depicts the total principal and interest payment of the hypothetical account of Fig. 6. As will be appreciated, the payments to the account holder
5 increase substantially over time. Fig. 8 graphically displays the "bookable" income components of the periodic retirements of the hypothetical deposit account. Note that the interest payments on the original deposit decreases in "straight-line" fashion with time, whereas
10 the bookable accrued inflation adjustment and interest on accrued adjustment peak at approximately year 21 before declining.

15 b. Comparing The Effects of Anticipated
 Levels of Inflation on the Account

The data processing methodology of the present invention may be used to compare the cash flow characteristics of a particular type of deposit account for
20 selected or anticipated levels of inflation. For example, Table I, which was generated using the servicing scheme of Fig. 4, numerically displays the cash flow characteristics of the typical Group IV account of the present example (i.e., it assumes an 8% level of inflation and a 4% fixed
25 interest rate). Depicted therein are the periodic (i.e., yearly) bookable inflation adjustment, interest earned, deposit returned (i.e., principal retired), year-end account balance and the net cash flow.

30 Table II was also generated using the flow scheme of Fig. 4 and displays the cash flow characteristics of the same Group IV account but including an anticipated inflation rate of 6% instead of 8%. All other variables, including the term, deposit amount and fixed interest
35 rate, are the same. The comparative cash flows for 8% and 6% inflation are displayed graphically in Fig. 9. Note

20

5 Thus, by inserting various anticipated inflation rates into the servicing schemes of the present invention, the effects of inflation on the resultant cash flows of the account may be ascertained. In this manner, the effects of such accounts on the capital structure of the account holder may be anticipated and both cases prove
10 that the depositor would receive a stream of payments with constant buying power at any time in the future regardless of the behavior of inflation.

Example II:
The Partially-Hedged Program

A lending institution, under certain circumstances, may desire to match an inflation-adjusted deposit account with a standard-fixed-payment mortgage loan. Under such a "partially-hedged" match, the net cash flow to the institution during periods of lower inflation will be higher than during periods of high inflation. That is, the standard-fixed-payment loan will generate a fixed cash flow whereas the deposit account must be satisfied with the inflation-adjusted dollars.

For example, Fig. 10 displays the buildup of positive cash flow from an original \$100 inflation-adjusted Group IV deposit account and a standard-fixed-payment loan program which are tracked for 30 years under the assumption that the deposits were used to fund 5-year loans at 10.5%, payable monthly, with principal amortized in equal semiannual payments and with net cash flows reinvested immediately on the same basis. These loan

proceeds are compared to the cash obligations on the deposit account.

These calculations from a simultaneous deposit-loan transaction do not include any of the costs of loan administration or the servicing costs of the deposit account, which is minimal with large institutional deposits. The servicing fee has been netted out but there is no need to deduct the customary costs of a retail deposit activity from this spread.

Though the net interest spread is quite large not all of this cash flow needs to be immediately reflected as income for tax purposes since the inflation adjustment interest must be recognized as an expense for accounting and tax purposes. The accrual of the interest expense has the effect of reducing taxable income in the early years of the deposit account term. The accrual of the inflation adjustment interest to the deposit account balance is accurately reflected in the intermediaries' deposit liabilities and also in the intermediaries' net worth.

Table III shows both asset and liability balance adjustments through the 30-year term on the original \$100 deposit and loan as well as the net return on assets. Even with only a 10.5% loan fixed rate, the net return on assets is reasonably high at 1.11% and grows over time. Tables IV and V convey the same information under an assumed loan rate of 11.5% and 12.5%, respectively. As one of skill in the art will appreciate, these higher loan rates substantially increase the net return on assets.

Interest Rate Risk

The actual net income and return on assets would depend on the spread of the loan rate above the cost of

00274 2929560

09550752 044700

funds. The cost of funds in turn depends on the inflation rate. In a fixed rate market with a 10.5% prime rate and less than 4% inflation the spread is quite large and would result in a return on assets of approximately 2.5% if all
5 funds were loaned out at prime.

An acceleration in inflation rates causes financial markets to adjust to higher inflation rates by increasing interest rates. If a surge of inflation were to occur
10 this would work to the intermediary's benefit. Since short-term loan rates are highly sensitive to an acceleration of inflation, revenues should respond immediately whereas the inflation interest cost accrues but is paid out smoothly over time.

15 Furthermore, the market's response to inflation causes bank loan rates to increase more than the inflation rate. For example, in 1979 when inflation rates peaked out at 13%, prime reached 21% which would have substan-
20 tially increased the bank's cash flows and after tax spreads. Acceleration of inflation and interest rates insulates the commercial bank from the payment shock of higher money market CD rates and widens the spread.

25 Generally with high interest rates and tight monetary policy there is a yield curve inversion in which short-term rates exceed long-term rates. This too would open enormous profit opportunities for the commercial
intermediary since the inflation-adjusted deposit funds
30 are borrowed long and lent short.

The more significant risk to the commercial intermediary is from a reduction of inflation and interest rates. This, however, presents no special difficulties
35 because the inflation interest is scaled down to the actual inflation rate. From the lending side lower

Example III:
The Fully-Hedged Program

a. Hedging the Interest Rate Risk

20 It is possible to fully hedge the inflation interest
cost by lending funds received by the intermediary in
deposit accounts on an inflation-adjusting loan rate
basis. An intermediary could, for example, make funds
available to corporate borrowers for medium-term corporate
25 needs of between 3 and 10 years. The present invention
provides an inflation-adjusting loan account similar in
structure to the inflation-adjusted deposit but,
preferably, with a shorter maturity. Again, the lengthy
deferrals on the deposit and the shorter repayment
30 schedules on the loan allows the intermediary bank to
capitalize on the time value of the more rapid principal
repayment on the assets than is needed to service the
liabilities. The return on assets is magnified by these
deferrals.

Such hedging would eliminate real interest rate risk during the term of the account having the shortest maturity, but would not achieve a "matched" asset and liability balance for the intermediary. This variation of the hedged program is not fully matched because there are dissimilar terms to maturity of the loan accounts as compared to the deposit accounts. Thus, when the term of both accounts are dissimilar, some degree of risk will still be present for the intermediary. This is because upon renewal of the account having the shorter term, a variation in fixed or "real" interest rates may have developed in the market. And potentially, the intermediary could find itself with unbalanced cash flows. The different terms would also leave the intermediary with an unmatched balance sheet. However, it may nevertheless be desirable for intermediaries to hedge inflation-adjusted loan and deposit accounts without fully matching terms because certain intermediaries may be unable to solicit sufficient numbers of long-term loan accounts with adequate underwriting characteristics to satisfy a fully matched program.

b. The Fully Hedged "Matched" Program

It is also possible to exactly match the inflation-adjusting deposit with an inflation-adjusting loan of equal maturity which would totally reduce the financial risk from variable inflation rates and yield curve inversions. In this case, the intermediary would be servicing long-term loans, most likely to finance real estate or other durable plant and equipment. With similar maturities of both the loan and deposit accounts, the intermediary can earn a constant spread over its cost of money with matching deposit and loan contracts. This would fully hedge the real interest rate risk. These

loans would also generate substantial front end fees for the intermediary.

Table VI illustrates the effect on the balance sheet and cash flow of an intermediary when the intermediary takes the excess cash flow generated by the matched accounts and reinvests this in new loan accounts with similar terms to the original account. In contrast to Table III, there are generally origination fees associated with such long term loans, which would be equal to the arrangement fees charged by the organizer. It can be observed in Table VI that the total net worth generated by such a fully matched program would be more advantageous to the intermediary than the total net worth generated by a situation such as depicted in Table III, in spite of the fact that receipts by the intermediary would be substantially lower in the initial years than those generated by the partially hedged programs.

Again, in contrast to the situation of a partially hedged program, the exact match between the loan and the deposit account results in identical net cash flow and net income, without the need to rely upon the current tax code in order to generate an additional advantage to the intermediary. The fully matched program will also have in effect a higher initial return on average assets. It should be pointed out that Table VI assumes that the income from the loan accounts flows into the intermediary on a monthly basis and the payments due the deposit account holder must be made on a yearly basis. In this period of time, the intermediary has had the opportunity to invest these funds at the stated float investment rate.

Table VII shows the situation under a fully hedged matched program wherein the loan account and deposit account both have an initial balance of \$100 and a term of

00550752 04300

The advantages of such a loan program to the intermediary are further depicted in Table VII in the remaining column, where in this case an assumption has been made that a property with a market value of \$125 is financed by the loan account, and the loan granted by the intermediary represents 80% of the value of such a property. Table VII further makes an assumption that the property increases in value over time in direct proportion to inflation and as a result if such a property generated operating net income before debt service at a rate of 9.5% of its value such operating income would increase over time also in direct proportion to inflation.

The next column of Table VII titled Loan to Value Ratio shows how each year the principal repayment which takes place reduces the loan to value ratio from the initial 80% to levels of 60% by year 11, 40% by year 19, 21% by year 25 and essentially 0 by the end of the 30th year. The debt coverage ratio which is calculated by

03550752 " 044700

rate and yet by the 30th year is still higher than 1. This means that the income generated by the property will fully cover the cost of debt service associated with the loan at that time.

5

While matching will reduce the interest rate exposure of the intermediary it will not increase credit risk. In fact, because the borrower's debt service on an inflation-adjusting loan with a 300 basis point markup is quite modest at 8.25 per \$100, there is substantial debt coverage.

This option is especially attractive to intermediaries that undertake interim construction loans on real estate because the long-term inflation-adjusting deposit accounts with its potential to finance a long-term inflation-adjusting Mortgage loans would provide permanent takeout money for the intermediary. This would be true either by design or necessity. In this case the intermediary enters a fully matched-book program on a long-term rather than a short-term basis.

In order to maintain the longevity of the match, the deposit and loan account would provide for substantial penalties for early withdrawal and correspondingly, the loan account would carry a substantial prepayment penalty. These penalties do not significantly detract from the appeal of both the deposit and loan accounts.

The foregoing invention has been described in terms of preferred embodiments. However, those of skill in the art will recognize that many variations of such embodiments exist. Such variations are intended to be within the scope of the present invention and the appended claims.

WHAT IS CLAIMED IS:

1. A system for managing deposit and loan accounts comprising:

5

a deposit account for a term, the deposit account being administered by an institution and having a deposit principal component and a deposit accrual component;

10

means for determining the rate of inflation;

means for determining the amount in the deposit accrual component, responsive to the rate of inflation;

15

means for retiring the deposit account over the term;

20

a loan account for a term, the loan account being administered by the institution and having a loan principal component and a loan accrual component;

25

means for determining the amount in the loan accrual component; and

means for retiring the loan account over the term.

30 2. The system of claim 1 wherein the means for determining the amount in the loan accrual component is responsive to the rate of inflation.

35 3. The system of claim 1 wherein the means for retiring the deposit account comprises a means for retiring the

09507532 04400

accrual component by a first schedule over the term and further comprises a means for retiring the principal component by a second schedule over the term.

5

4. The system of claim 1 further comprising a means for enhancing the deposit principal component responsive to the accrual component and wherein the means for retiring the deposit account comprises a means for retiring the principal component by schedule over the term.

5. The system of claim 1 or 2 wherein the deposit accrual component comprises a fixed interest component and a variable interest component.

6. The system of claim 5 further comprising:
means for enhancing the deposit principal component responsive to the variable interest component;
and

wherein the means for retiring the deposit account comprises:

means for retiring the fixed interest component by a first schedule over the term; and

means for retiring the deposit principal component by a second schedule over the term.

7. The system of claim 5 further comprising:

means for enhancing the deposit principal component
responsive to the variable interest component;
5 and

wherein the means for retiring the deposit account
comprises:

10 means for retiring the fixed interest component by a
first schedule over the term; and

means for retiring the deposit principal component by
amortization over the term.

15

8. The system of claim 1 or 2 wherein the means for
retiring the loan account comprises a means for retiring
the accrual component by a first schedule over the term
20 and further comprises a means for retiring the principal
component by a second schedule over the term.

9. The system of claim 1 or 2 further comprising a means
25 for enhancing the loan principal component responsive to
the accrual component and wherein the means for retiring
the loan account comprises a means for retiring the
principal component by schedule over the term.

30

10. The system of claim 1 or 2 wherein the loan accrual
component comprises a fixed interest component and a
variable interest component.

35

5

10

15

20

25

30

35

13. The system of claim 1 or 2 wherein means for determining the amount in the deposit accrual component or loan accrual component comprises means for data processing.

14. The system of claim 1 or 2 wherein means for retiring the deposit account or loan account comprises means for data processing.

5

15. The system of claim 1 or 2 wherein means for determining the rate of inflation comprises means for data processing.

10

16. The system of claims 1 or 2 wherein means for determining the rate of inflation is responsive to the consumer price index.

15

17. The system of claim 1 wherein the deposit account is a certificate of deposit.

20

18. The system of claim 1 wherein the loan account is a mortgage account.

19. A method of providing an improved capital structure for a financial institution comprising:

30

providing at least one deposit account for a term, the deposit account having a deposit principal component and a deposit accrual component;

determining the rate of inflation;

adjusting the amount in the deposit accrual component in a manner responsive to the rate of inflation; and

35

11

10

15

20

•

25

30

retiring the fixed interest component by a first
schedule over the term; and

35

24. The method of claim 22 further comprising:

enhancing the deposit principal component in a manner
responsive to the variable interest component;
5 and

wherein retiring the deposit account comprises:

retiring the fixed interest component by a first
10 schedule over the term; and

retiring the deposit principal component by
amortization over the term.

15

25. The method of claim 19 further comprising:

providing at least one loan account for a term, the
loan account having a loan principal component
20 and a loan accrual component;

determining the amount in the loan accrual component
in a manner responsive to the rate of inflation;
and

25

retiring the loan account over the term.

26. The method of claim 25 wherein retiring the loan
30 account comprises retiring the accrual component by a
first schedule over the term and further comprises
retiring the principal component by a second schedule over
the term.

35

00550753-04400

5

10

29. The method of claim 28 further comprising:

15

wherein retiring the loan account comprises:

20

retiring the loan principal component by a second
schedule over the term.

25

30. The method of claim 28 further comprising:

30

wherein retiring the loan account comprises:

35

retiring the loan principal component by amortization
over the term.

- 5 31. A method of providing an improved capital structure
for a financial institution comprising:

10 matching at least one deposit account for a term with
at least one loan account for a term, each
account having a principal component and an
accrual component;

determining the rate of inflation;

15 adjusting the accrual component of each account in a
manner responsive to the rate of inflation; and

retiring the accounts over their respective terms.

20

32. The method of claim 31 wherein matching the deposit
account with the loan account comprises:

25 receiving a deposit commitment for at least one
deposit account;

designating an institution to receive the deposit
account; and

30

placing the deposit account with the institution.

33. A method of providing an improved capital structure
for a financial institution comprising:

35

00550752 041700

11

5

10

placing the deposit account with the institution.

ABSTRACT

5 Data processing for novel form of relationship
management links, supervises, and balances depositors,
marketing agents, financial intermediaries, mortgage
brokers, and borrowers in an inflation-adjusted financing
program. Funds are deposited in participating financial
institutions in return for certificates of deposit
yielding a fixed rate of interest, plus principal growth
10 at a yearly rate equal to that year's rate of growth in
the Consumer Price Index-All Urban Consumers, All Items.
Funds on deposit are loaned to borrower, either directly
or through brokers, at a rate calculated by adding three
components: a fixed debt service rate, a fixed constant
15 interest rate, and an inflation factor interest rate which
reflects the effects of inflation on the outstanding loan
balance. Organizing company synchronizes entire program by
contacting depositors through marketing agent, designating
institutions to receive depositors' funds, contacting
20 borrowers directly or through brokers, and by supplying
data processing capabilities to financial intermediaries
for purposes of implemtation of the program and for
analysis of the effects of the program on the
intermediaries' capital structures.

DECLARATION

ARAI.007700

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled _____

Investment Management

the specification of which: .

☐ is attached hereto.

☒ was filed on August 27, 1985 as Application Serial No. 770,493.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, § 1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, § 119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

PRIOR FOREIGN APPLICATION(S)

(Number)	(Country)	(Date Filed)	Priority Claimed Yes/No

I hereby claim the benefit under Title 35, United States Code, § 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, § 112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, § 1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

(Application Serial No.)	(Filing Date)	(Status)

I hereby direct that all correspondence and telephone calls be addressed to Charles D. Huston, Arnold, White & Durkee, P.O. Box 4433, Houston, Texas 77210, (713) 789-7600.

I hereby declare that all statements made of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
